

Project - 3.5.4 Creating Realistic Images with GANs:

Primary Goal

Generate realistic synthetic images using Generative Adversarial Networks (GANs) trained on the CIFAR-10 dataset

Developed By : Niraunjana Gayathri G R
Department : AI&DS
Register No. : 212222230096
Batch : AIML'25

Objectives

Specific Objectives

- Implement Generator and Discriminator neural networks
- Train GAN using adversarial loss function
- Apply training stability techniques
- Evaluate image quality progression across training epochs
- Generate diverse, high-quality synthetic images resembling CIFAR-10 classes

Dataset & Preprocessing

CIFAR-10 Dataset

- **Size:** 60,000 32×32 color images
- **Classes:** 10 categories (airplane, automobile, bird, cat, deer, dog, frog, horse, ship, truck)
- **Split:** 50,000 training + 10,000 test images

Preprocessing Steps

- Normalization to $[-1, 1]$ range for stable training
 - Data augmentation (if applied)
 - Batch processing for efficient GPU utilization
 - Tensor conversion for PyTorch compatibility
- 
- 

Model Architecture Summary

Generator Network

- **Input:** Random noise vector (latent space)
- **Architecture:** Deep Convolutional layers with upsampling
- **Output:** $32 \times 32 \times 3$ RGB images
- **Activation:** Tanh output layer for $[-1,1]$ range

Discriminator Network

- **Input:** $32 \times 32 \times 3$ real or generated images
- **Architecture:** Convolutional layers with downsampling
- **Output:** Single probability score (real vs fake)
- **Activation:** Sigmoid output for binary classification

Loss Functions

- **Generator Loss:** Maximizes discriminator's error on fake images
- **Discriminator Loss:** Minimizes error on both real and fake images

Training Stability Techniques

Implemented Stabilization Methods

- **Batch Normalization:** Applied in both networks for stable gradients
- **LeakyReLU Activation:** Prevents dying neurons in discriminator
- **Learning Rate Scheduling:** Balanced learning rates for G and D
- **Label Smoothing:** Soft labels (0.9 instead of 1.0) for real images

Training Configuration

- **Epochs:** 50+ training iterations
- **Batch Size:** Optimized for memory efficiency
- **Optimizer:** Adam with $\beta_1=0.5$, $\beta_2=0.999$
- **Loss Monitoring:** Tracked D_loss and G_loss convergence

Training Progress Analysis

Loss Evolution (Based on Screenshots)

- **Epoch 0:** D_loss=1.8163, G_loss=0.7240
- **Epoch 10:** D_loss=1.2431, G_loss=0.7111
- **Epoch 20:** D_loss=1.2439, G_loss=0.6139
- **Epoch 30:** D_loss=1.1686, G_loss=1.3724
- **Epoch 40:** D_loss=1.0784, G_loss=0.7882
- **Epoch 50:** D_loss=1.1305, G_loss=0.8160

Training Observations

- Gradual improvement in loss stability
- Balanced competition between Generator and Discriminator
- Successful convergence without mode collapse

Generated Image Quality Evolution

Visual Progress Across Epochs

- **Epoch 10:** Initial recognizable patterns emerging
- **Epoch 20:** Improved structure and color definition
- **Epoch 30:** Better texture and object boundaries
- **Epoch 40:** Enhanced detail and realism
- **Epoch 50:** High-quality synthetic images with diverse features

Quality Metrics Observed

- Improved edge definition over training
- Better color distribution matching CIFAR-10
- Increased diversity in generated samples
- Reduced artifacts and noise

Key Observations & Learning

Technical Insights

- **Adversarial Training Dynamics:** Successful balance between generator and discriminator learning
- **Architecture Importance:** Deep convolutional layers crucial for image quality
- **Hyperparameter Sensitivity:** Learning rates and batch size significantly impact stability

Challenges Overcome

- **Mode Collapse Prevention:** Achieved through proper regularization
- **Training Instability:** Resolved with batch normalization and learning rate tuning
- **Memory Optimization:** Efficient batch processing for resource management

Generated Image Characteristics

- Successfully learned CIFAR-10 data distribution
- Generated diverse samples across different object categories
- Maintained realistic color schemes and textures

Results & Performance

Quantitative Results

- **Training Duration:** 50+ epochs successfully completed
- **Loss Convergence:** Stable adversarial loss balance achieved
- **Image Quality:** Progressive improvement from epoch 10 to 50
- **Diversity:** Generated samples show variation within learned distribution

Qualitative Assessment

- Generated images exhibit CIFAR-10 characteristics
- Clear improvement in visual quality over training epochs
- Successful synthesis of realistic textures and shapes
- No evidence of mode collapse or training instability

Epoch 0: D_loss=1.8163, G_loss=0.7240
Epoch 10: D_loss=1.2431, G_loss=0.7111
Epoch 20: D_loss=1.2439, G_loss=0.6139
Epoch 30: D_loss=1.1686, G_loss=1.3724
Epoch 40: D_loss=1.0784, G_loss=0.7882
Epoch 50: D_loss=1.1305, G_loss=0.8160

Conclusion

Project Success

✓ **Successfully implemented** functional GAN architecture for CIFAR-10 ✓ **Achieved stable training** with balanced adversarial loss ✓ **Generated high-quality** synthetic images resembling real data ✓ **Applied effective** training stabilization techniques

Key Achievements

- Demonstrated understanding of adversarial training principles
- Successfully handled training instabilities common in GANs
- Produced visually appealing and diverse generated samples
- Implemented comprehensive monitoring and visualization system

Future Improvements

- Experiment with advanced architectures (StyleGAN, Progressive GAN)
- Implement quantitative evaluation metrics (FID, IS scores)
- Explore conditional generation for specific classes
- Scale to higher resolution datasets

The background is decorated with various hand-drawn blue doodles. These include several loops and swirls in the top left, a scribbled circle in the top center, overlapping loops in the top right, a star-like shape on the far right edge, and a series of small 'v' marks and a wavy line in the bottom center. There are also some larger, looser loops in the bottom left and bottom right corners.

Thank you
